

In the Specification:

On page 1, after line 2, insert the following:

--Field of the Invention

The present invention relates to a method for producing a receptacle which consists of a substantially stiff outer receptacle and an easily deformable inner bag which are made from respectively different thermoplastic materials that do not form a welded joint with one another.

Background of the Invention--

On page 2, after line 21, insert the following:

--Summary of the Invention

According to the invention this object is achieved by a method for producing a receptacle consisting of a substantially stiff outer receptacle and an easily deformable inner bag which are made from respectively different thermoplastic materials that do not form a welded joint with one another. The receptacle comprises a receptacle opening and at least one wall opening provided in the outer receptacle, through which pressure is compensated in the area between the inner bag and the outer receptacle. A parison consists of at least two tubings, being coextruded and arranged between the opened halves of a blow mold. The blow mold is subsequently closed when the parison has reached the length required for producing the receptacle, excess material being squeezed off in the bottom area of the receptacle to be produced. A web made of welded material of the outer receptacle is formed, in which web the welded bottom seam of the inner bag is clamped and held in an axial direction. The parison is inflated by a pressure medium for contact with the wall of the

blow mold and removed from the blow mold. At least one wall opening is formed by a tool having an uneven surface which oscillates at a high oscillation frequency and removes wall material in dust-like particles.--

On page 3, after line 1, delete this paragraph.

On page 4, after line 21, insert the heading:

--Brief Description of the Drawings--

On page 5, after line 3, insert the heading:

--Detailed Description of a Preferred Embodiment--
